

Project Development Phase

During the **Project Development Phase** of **ComicCraft – AI Comic Story Creator using Gemini Models**, the planned design is converted into a working application.

- **Frontend Development:** Create the user interface for entering story ideas, selecting comic styles, and viewing generated comics.
- **Backend Development:** Develop the application logic and API services to process user requests.
- **AI Integration:** Integrate **Google Gemini models** for story generation, character development, dialogue creation, and scene descriptions.
- **Comic Generation:** Convert the generated story into structured comic panels with captions and dialogues.
- **Database & Storage:** Implement storage for user inputs, generated stories, characters, and comic outputs where required.
- **Testing & Debugging:** Test each module, fix errors, and verify that frontend, backend, and AI components work together correctly.
- **Integration:** Combine all modules into a complete **ComicCraft** application and prepare it for final testing and deployment.
